## Measures of sequence diversity

sequence	sites							
ancestor	· C ·	· C ·	· A ·	· T ·	· A ·	· G ·	· C ·	· G ·
a	С	Т	A	G	С	G	С	Т
b	C	${ m T}$	${ m T}$	G	$\mathbf{C}$	${ m T}$	G	${ m T}$
$\mathbf{c}$	G	${ m T}$	A	${ m T}$	$\mathbf{C}$	G	G	${ m T}$
d	G	$\mathbf{C}$	A	${ m T}$	A	G	$\mathbf{C}$	G
e	C	${ m T}$	A	G	$\mathbf{C}$	G	$\mathbf{G}$	${ m T}$
$\mathbf{f}$	C	$\mathbf{C}$	A	${ m T}$	$\mathbf{C}$	G	$\mathbf{G}$	${ m T}$

- 1. What is S (number of segregating sites) for this dataset? What is n (sample size)?
- 2. Compute the site frequency spectrum (SFS):  $\xi_i$  is the number of sites with i copies of the mutant/derived allele and n-i copies of the ancestral allele.

3. Use the SFS to compute the folded SFS:  $\eta_i$  is the number of sites with i copies of the minor allele.

4. Find a formula for computing the average pairwise heterozygosity  $\pi$  from the folded SFS. Use your formula to compute  $\pi$  for this dataset.
