- Input or **feature**: year
- Output or "label": sea ice

<sup>\*</sup>Arctic sea ice extend (1,000,000 sq km)

## **Data Representation Notation**

## Feature Terminology

- Features: feature names
  - i.e. shape
  - i.e. sea ice extent

- Feature values: what values are possible
  - i.e. {circle, square, triangle}
  - i.e. all non-negative values

- Feature vector: values for a particular example
  - i.e.  $\mathbf{x} = [x_1, x_2, x_3, ..., x_p]$

### Featurization: make numerical

• Real-valued features get copied directly.

Duame, Chap 3

- Binary features become 0 (for false) or 1 (for true).
- Categorical features with V possible values get mapped to V-many binary indicator features.

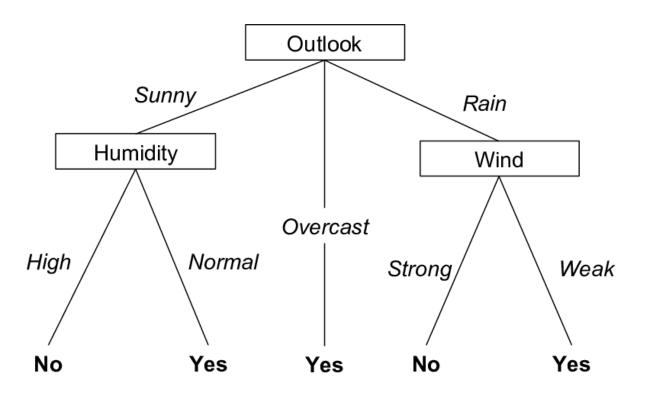

Q: what about features that might already be on a spectrum (i.e. sunny, rain, overcast)?

Data representation and featurization

Introduction to modeling

Why are models useful?

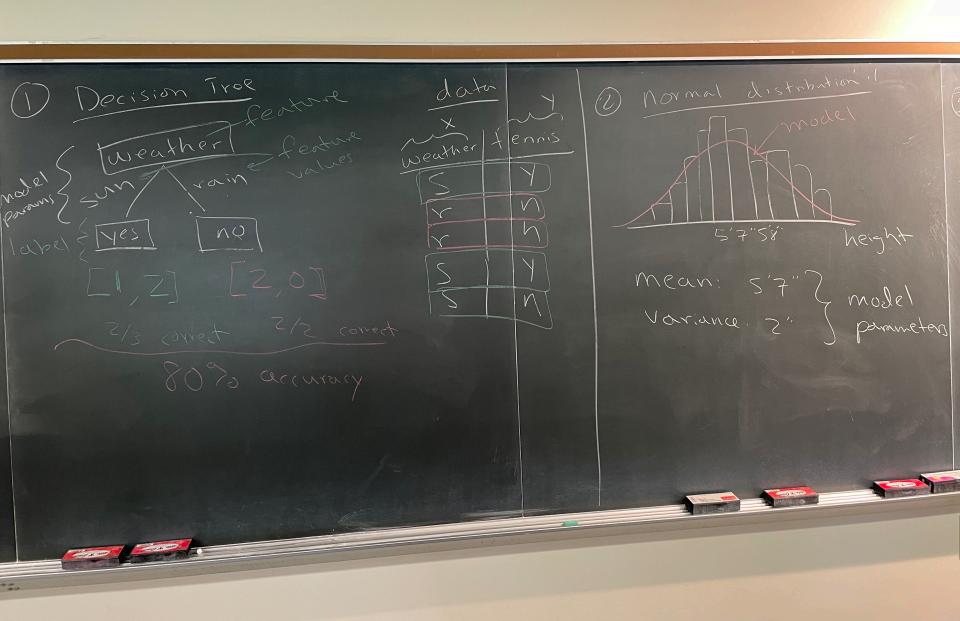

### Example of a model

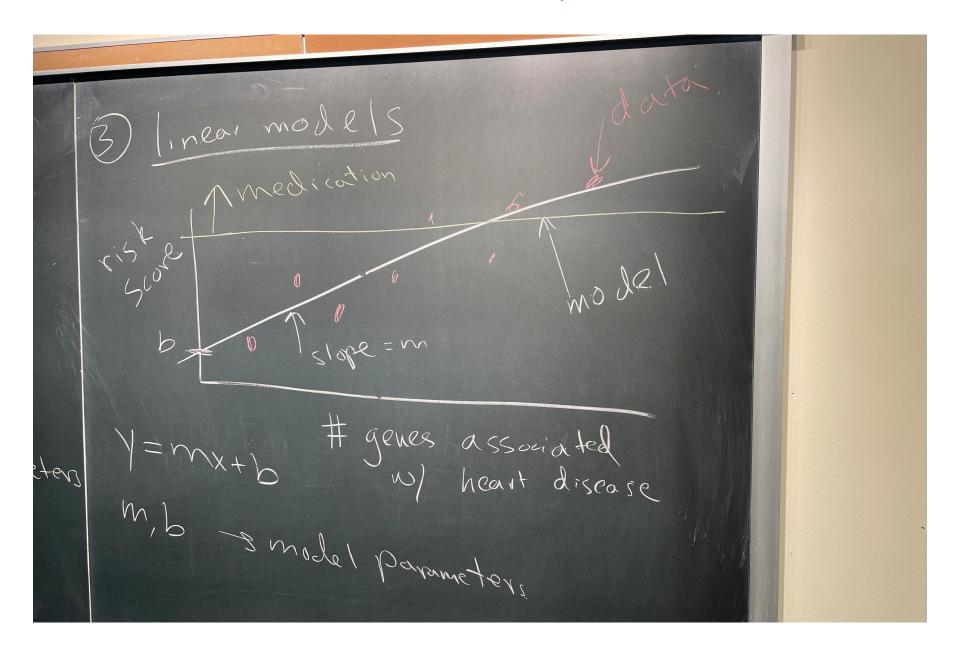

- Each internal node: one feature
- Each branch from node: selects one value of the feature
- Each leaf node: predict y

### **Model Examples**

### **Model Examples**

Q1: *n*=10, *p*=4

Day	Outlook	Temperature	Humidity	Wind	PlayTennis $(y)$
$oldsymbol{x}_1$	Sunny	Hot	High	Weak	No
$oldsymbol{x}_2$	Sunny	$\operatorname{Hot}$	$\operatorname{High}$	Strong	No
$  x_3  $	Overcast	$\operatorname{Hot}$	$\operatorname{High}$	Weak	Yes
$oldsymbol{x}_4$	Rain	Mild	$\operatorname{High}$	Weak	Yes
$oldsymbol{x}_5$	Rain	Cool	Normal	Weak	Yes
$oldsymbol{x}_6$	Rain	Cool	Normal	Strong	No

$oldsymbol{x}_8$	Sunny	Mild	$\operatorname{High}$	Weak	No
$oldsymbol{x}_9$	Sunny	Cool	Normal	Weak	Yes
$oldsymbol{x}_{10}$	Rain	Mild	Normal	Weak	Yes

Q2

Sunny:  $\{0,1\}$ Overcast:  $\{0,1\}$ Rain:  $\{0,1\}$ Temperature:  $\{0,1,2\}$  (Cool, Mild, Hot) Humidity:  $\{0,1\}$  (Normal, High) Wind  $\{0,1\}$  (Weak, Strong)

 $\boldsymbol{x}_1$ 

Sunny	Overcast	Rain	Temp	Humidity	Wind
1	0	0	2	1	0

Q4

In the model below, the children of each node divide the data into partitions. Label each node (both internal nodes and leaves) with the counts of "No" and "Yes" labels based on the partition. For example, the counts for the node labeled *Outlook* would be [4,6]. Does this model perfectly classify all examples?

	Outlook	Temp	Humidity	Wind
(test example) <i>x</i> =	Rain	Hot	High	Strong

 $y_{pred} = No$
