

# **CS 106**

# **INTRODUCTION TO**

# **DATA STRUCTURES**

**SPRING 2020**

**PROF. SARA MATHIESON**

**HVERFORD COLLEGE**

# ADMIN

- Lab 2 due **TOMORROW** (Wed night)
- Lab 3 posted tomorrow, due next Sunday
- Before lab this week, begin next pre-lab (okay to finish in lab)
  
- TA hours **tonight 7-9pm in H110**
- No office hours today (they were yesterday)

# ADMIN

All scheduling info is on the google calendar!

## CS106, Spring 2020

- **Doubly Linked Lists**
- **Equality and extras**

# FEB 18 OUTLINE

- **Introduce Lab 3**
- Recap Singly Linked Lists
- Motivation for Doubly Linked Lists (sorting)
- Doubly Linked Lists
- Equality and extras

# LAB 3: BABY NAMES

- **Goal:** create sorted lists of baby names using your own custom Nodes and Linked List class
- **Practice:** using command line arguments to let the user query their favorite names
- **Return:** information about the popularity of baby names in the U.S. over time
- **Note:** very gendered way of viewing this historical data, how could we change the way data is collected in the future?

Year: 2002

```
1, Jacob, 30568, Emily, 24463
2, Michael, 28246, Madison, 21773
3, Joshua, 25986, Hannah, 18819
4, Matthew, 25151, Emma, 16538
5, Ethan, 22108, Alexis, 15636
...
996, Ean, 157, Johana, 221
997, Jovanni, 157, Juana, 221
998, Alton, 156, Juanita, 221

```

# HANDLING INPUT

Where input goes when it is given to a Java program. Each space separated word becomes a different string in the args array.

```
public class Main {  
    public static void main(String[] args) {  
        // This is where you can parse the  
        // command line arguments  
    }  
}
```

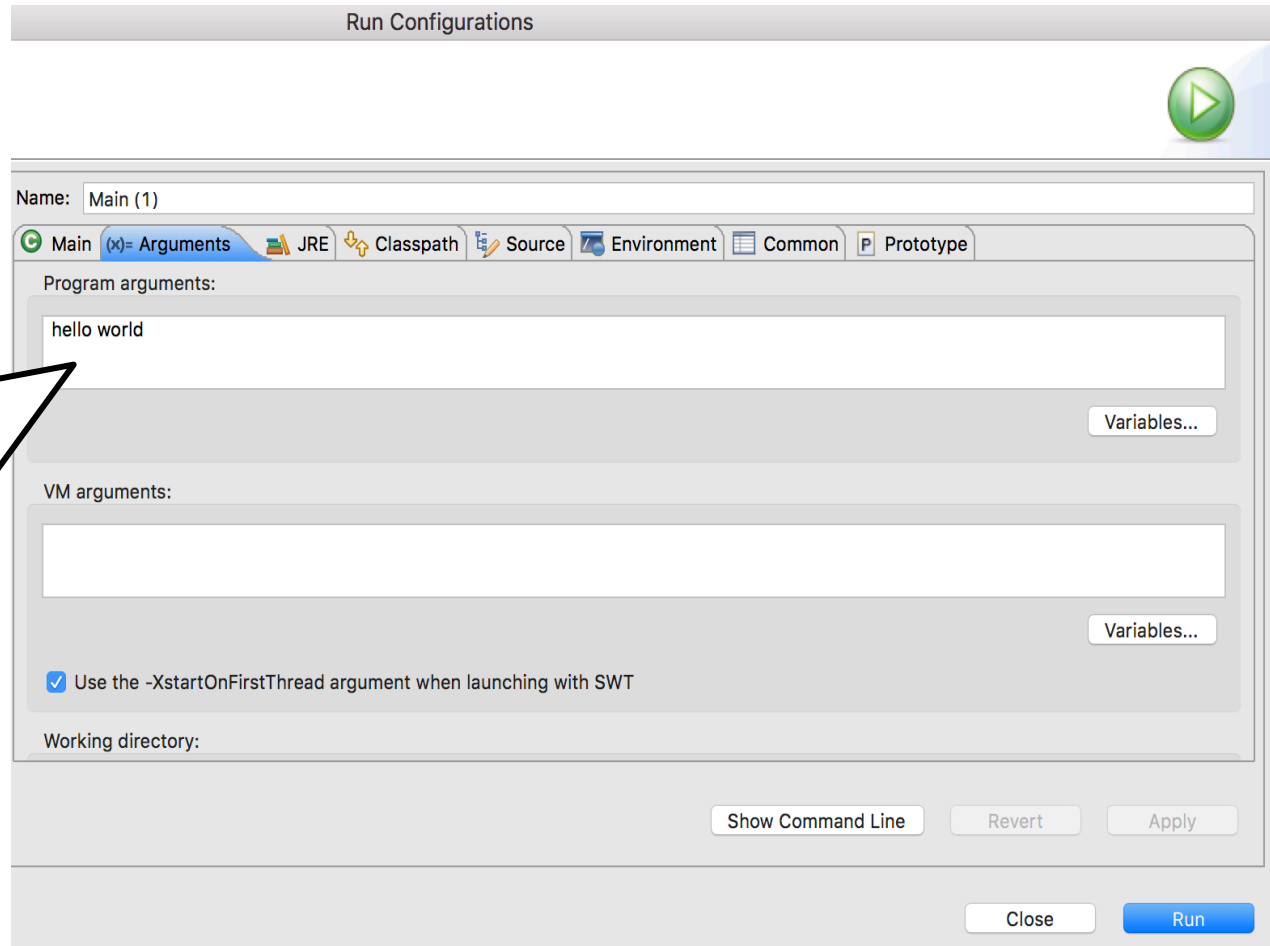

```
java Main arg0 arg1
```

What this looks like from the command line when the program is called with arguments.

# HANDLING INPUT IN ECLIPSE

Go to Run Configurations and choose Arguments:

The space-separated arguments that are given here are then passed into the main function as `String[] args`

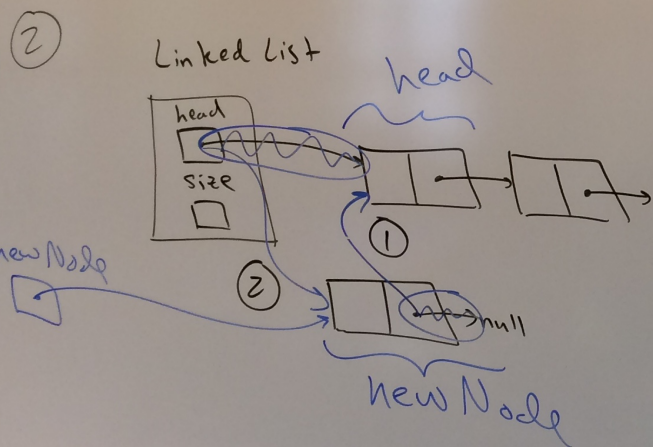

# FEB 18 OUTLINE

- Introduce Lab 3
- **Recap Singly Linked Lists**
  - Handout 9, hand back Handout 8*
- Motivation for Doubly Linked Lists (sorting)
- Doubly Linked Lists
- Equality and extras

# Handout 9

- ① Number of Courses: 3  
CS 105  
CS 106  
Math 102

add First  
 $\text{Node}\langle E \rangle$   $\text{new Node} = \text{new Node}\langle E \rangle (\text{new Data});$  *Constant:  $O(1)$*   
 $\text{new Node.setNext}(\text{head});$  *we will write*  
 $\text{head} = \text{new Node};$  *(for Lab 3 too)*  
 $\text{size} += 1;$

③ addLast :  $O(n)$  (linear)

with tail pointer:  $O(1)$

④ get(i) :  $O(n)$  (linear)

⑤ while  $\text{curr Node.next}() == \text{null}$

# JAVA NOTES

Each public class should be in its own file with the same name. The basic structure of a Java program looks like:

```
public class Name {  
    private int instanceVariable;  
  
    public Name(int instanceVar) {  
        this.instanceVariable = instanceVar;  
    }  
  
    public int getVariable() {  
        return this.instanceVariable;  
    }  
}
```

Instance variables should be private and at the top of the class file.

The constructor should have the same name as the class and should initialize the instance variables.

Note that all lines of code are either variable declarations or inside methods.

Methods, including getters and setters, should follow the constructor.

# JAVA CONSTRUCTORS AND INSTANCE VARIABLES

```
public class Demo {  
    private int var;  
  
    public Demo() {  
        this.var = 0;  
    }  
  
    public Demo(int var) {  
        this.var = var;  
    }  
}
```

(Non-static) instance variables are different for each instance (object) of the class type and are the main way to store data and meaning using a class.

The constructor should initialize all instance variables.

You can have more than one constructor for a single class as long as they take different arguments!

# JAVA VARIABLE DECLARATIONS

```
public class Demo {  
    private int var;
```

Variables are always **declared** (created) by indicating a type and a name.

```
    public Demo() {  
        this.var = 0;  
    }
```

Variables are **initialized** by setting the right hand side of the equals sign as the value of the variable.

```
    public void badFunction() {  
        int var = 5;  
    }
```

**Warning:** Putting a type in front of the variable name creates a **new** variable with that name.

```
}
```

# FEB 18 OUTLINE

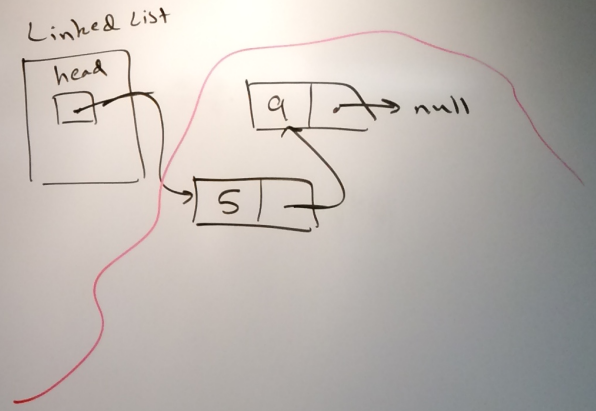

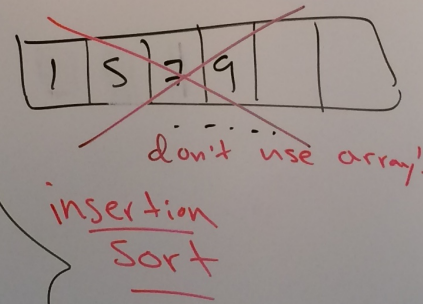

- Introduce Lab 3
- Recap Singly Linked Lists
- **Motivation for Doubly Linked Lists (sorting)**
- Doubly Linked Lists
- Equality and extras

# Doubly Linked List (motivation: sorting)

Example: { 9, 5, 1, 7, 3, 8 } Goal: sort  
↳ n = 6

- Linked List
- 1 { 9 }
  - 2 { 5, 9 }
  - 3 { 1, 5, 9 }
  - 4 { 1, 5, 7, 9 }
  - 5 { 1, 3, 5, 7, 9 }
  - 6 { 1, 3, 5, 7, 8, 9 }

# FEB 18 OUTLINE

- Introduce Lab 3
- Recap Singly Linked Lists
- Motivation for Doubly Linked Lists (sorting)
- **Doubly Linked Lists**
- Equality and extras

New Data = 20

Singly Linked List: hard to add to middle

Solution: Doubly Linked Lists

code: constructor

```
public Node(Data d) {  
    data = d;  
    prev = null;  
    next = null;  
}
```

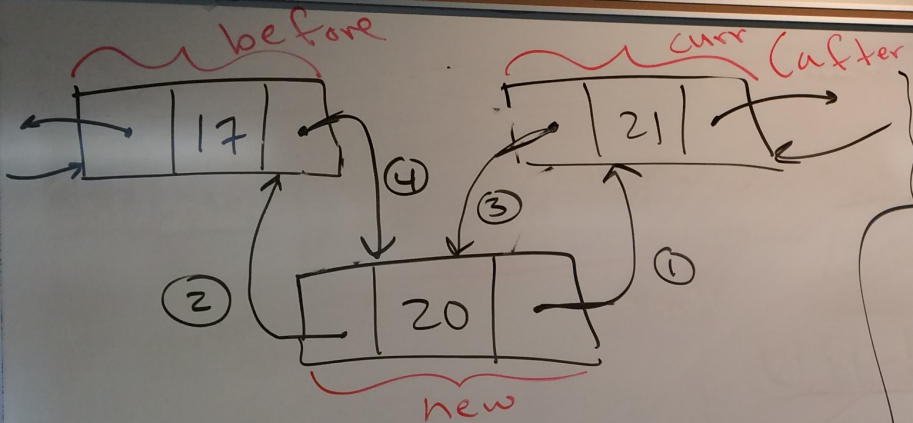

prev = curr

curr = curr.next

"walking"

new.next = curr

add Between: (4 lines)

- ①  $new.next = curr$
- ②  $new.prev = curr.prev$
- ③  $curr.prev = new$
- ④  $new.prev.next = new$

$before = curr.prev$

## Sentinels

$before.next = new$   
 ~~$curr$~~ .  $prev = new$   
 $new.next = curr$   
 $new.prev = before$

LL

Constructor:

$header = new Node(null)$   
 $trailer = new Node(null)$   
 ~~$head = null$~~   
 ~~$tail = null$~~

first element

# LINKED LIST VARIATIONS

Suppose we know that a data structure will be used for a specific task - we can make modifications to **linked lists** to make them better for that task!

Last time:

adding a **tail pointer** to make **adding to the end** of the list fast

Note:

There are many, many ways to implement and customize linked lists!

# DOUBLY LINKED LISTS

What if we want to be able to add / remove nodes in the middle of the list more easily?

Want more info? See book section 3.4.

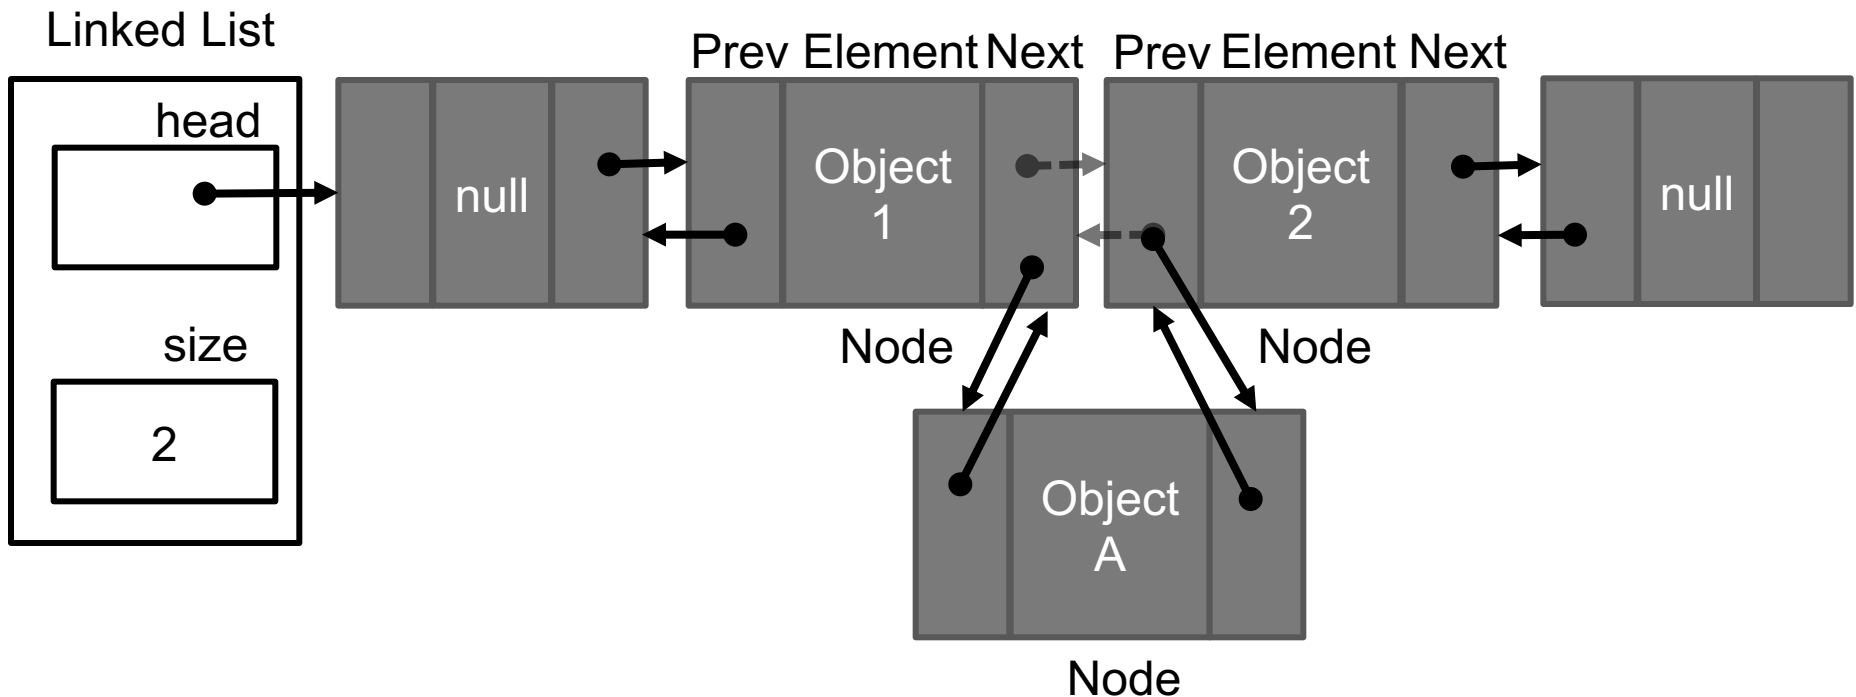

# DOUBLY LINKED LISTS

We can make the coding easier by adding sentinels.

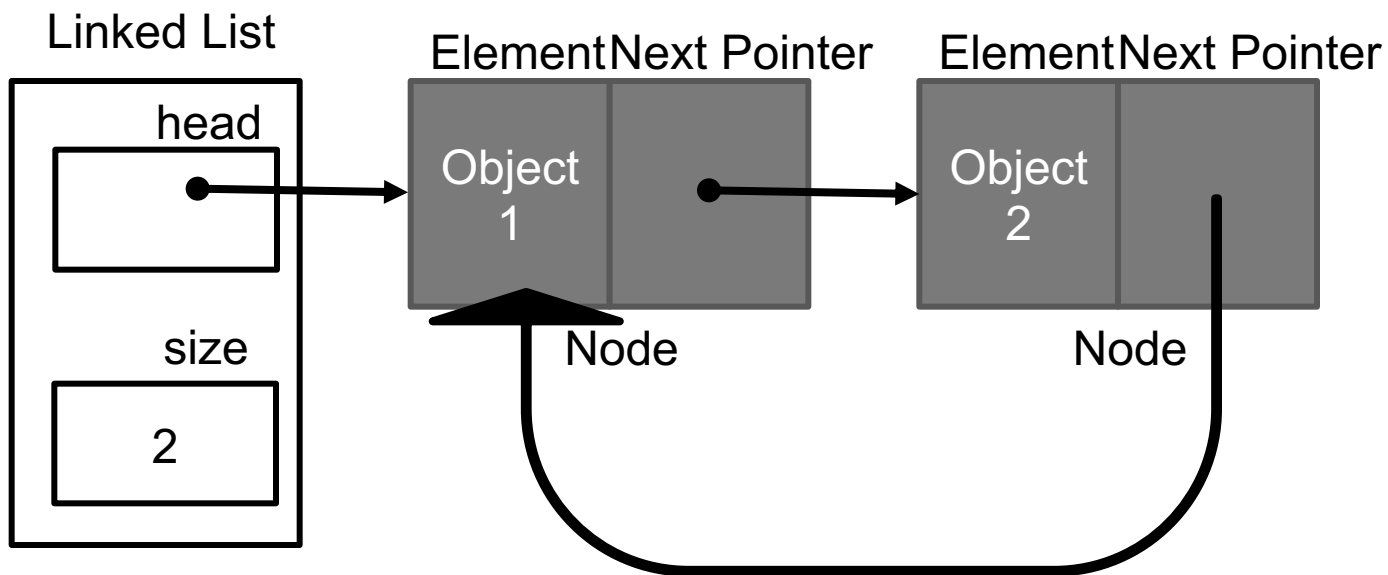

# Doubly Linked Lists - adding a Node

Suppose we already have a pointer to the node after the one we want to add - then we can make adding (and deleting) faster!

# CIRCULARLY LINKED LISTS

What if we want to support game play or round-robin scheduling?  
Make the linked list circular!

Want more info? See book section 3.3.

# FEB 18 OUTLINE

- Introduce Lab 3
- Recap Singly Linked Lists
- Motivation for Doubly Linked Lists (sorting)
- Doubly Linked Lists
- **Equality and extras**

# TESTING EQUALITY

**.equals** needs to be used to test String equality:

```
String str1 = new String("hello");  
String str2 = new String("hello");  
System.out.println(str1 == str2);           // false  
System.out.println(str1.equals(str2));      // true
```

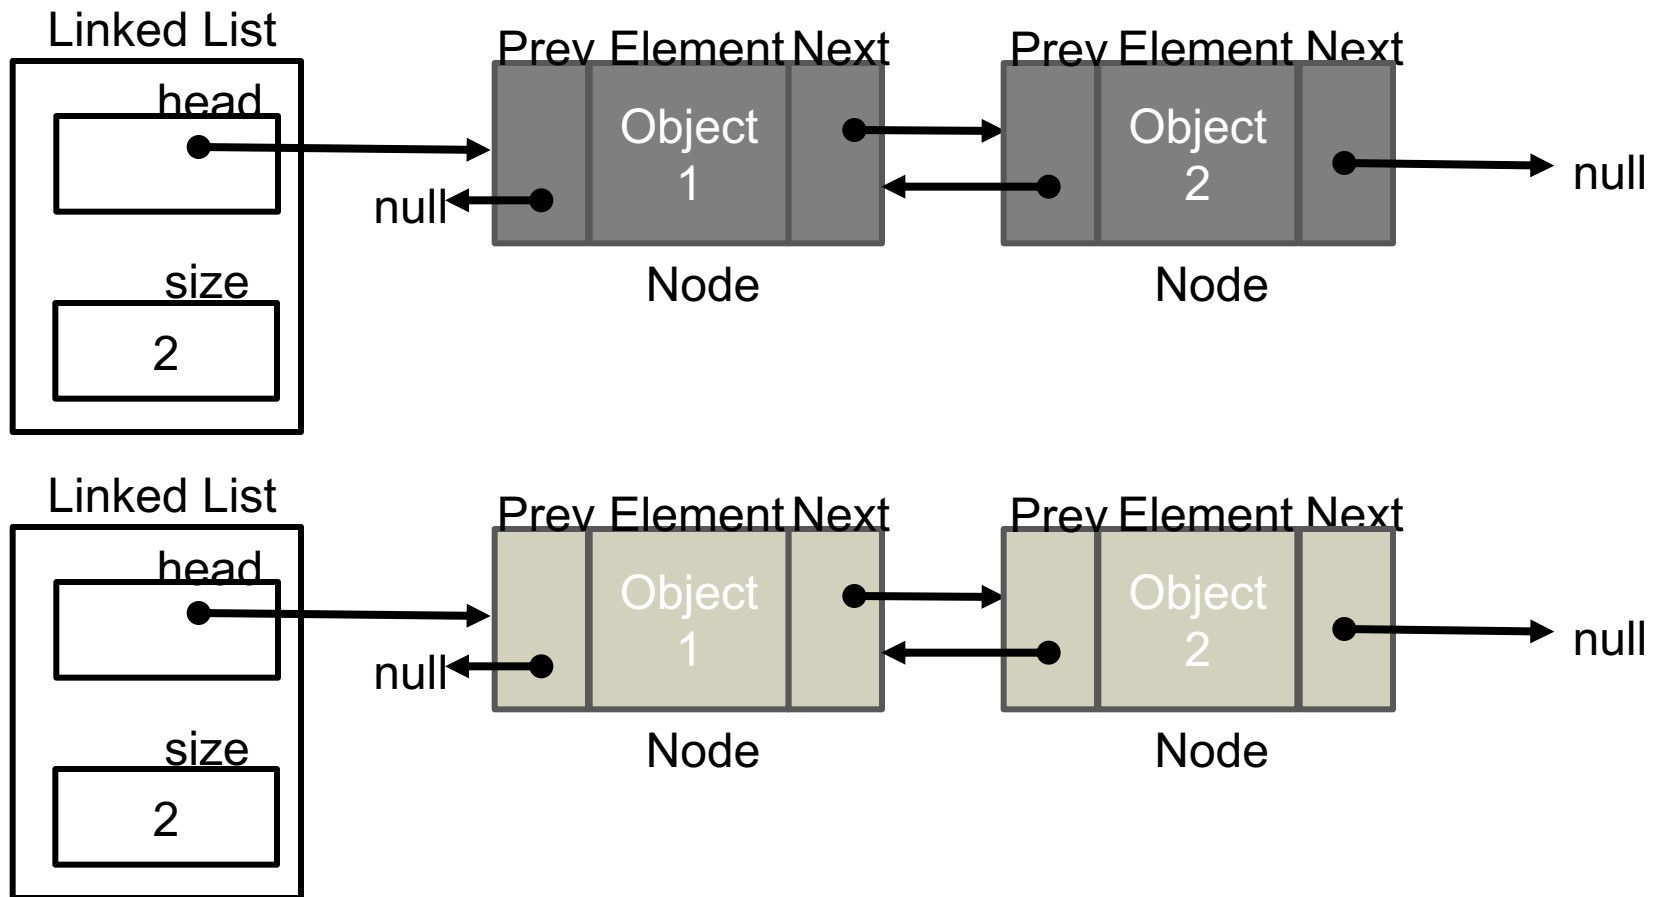

This is the case for all other Objects as well: **.equals** needs to be implemented in order to compare the *contents* and not the reference address.

For primitive types (int, bool, double) **==** is okay

Want more info? See book section 3.5.

# TESTING EQUALITY: LINKEDLISTS

How should equality be tested between LinkedLists?

# TESTING EQUALITY: LINKEDLISTS

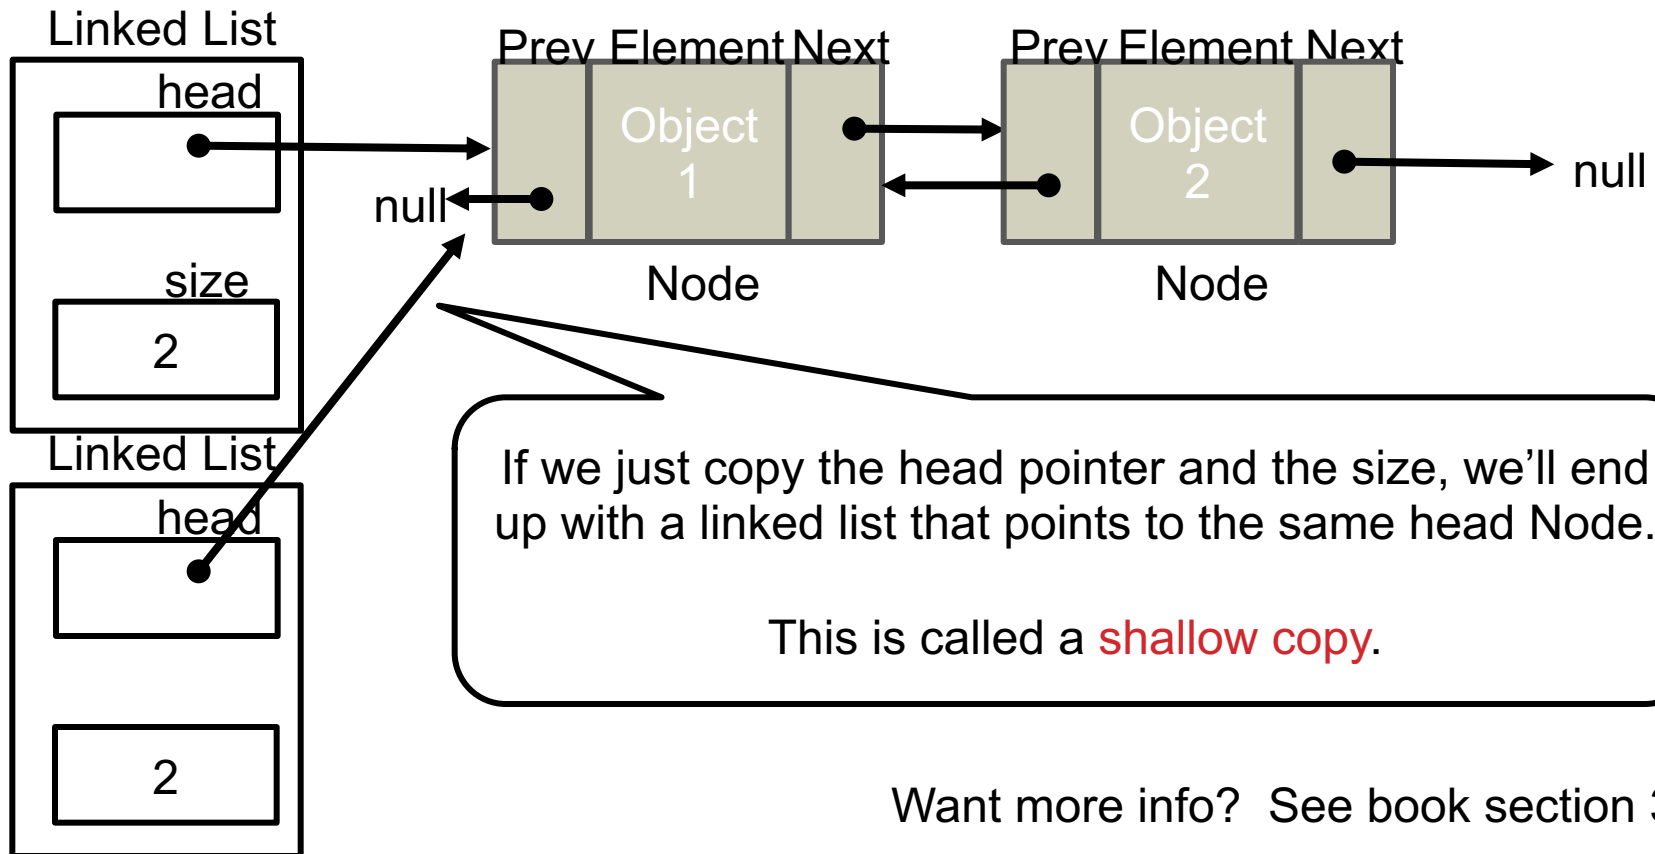

How should equality be tested between LinkedLists?

Implement `.equals` by traversing both lists and comparing the pairs of Node elements using `.equals`.

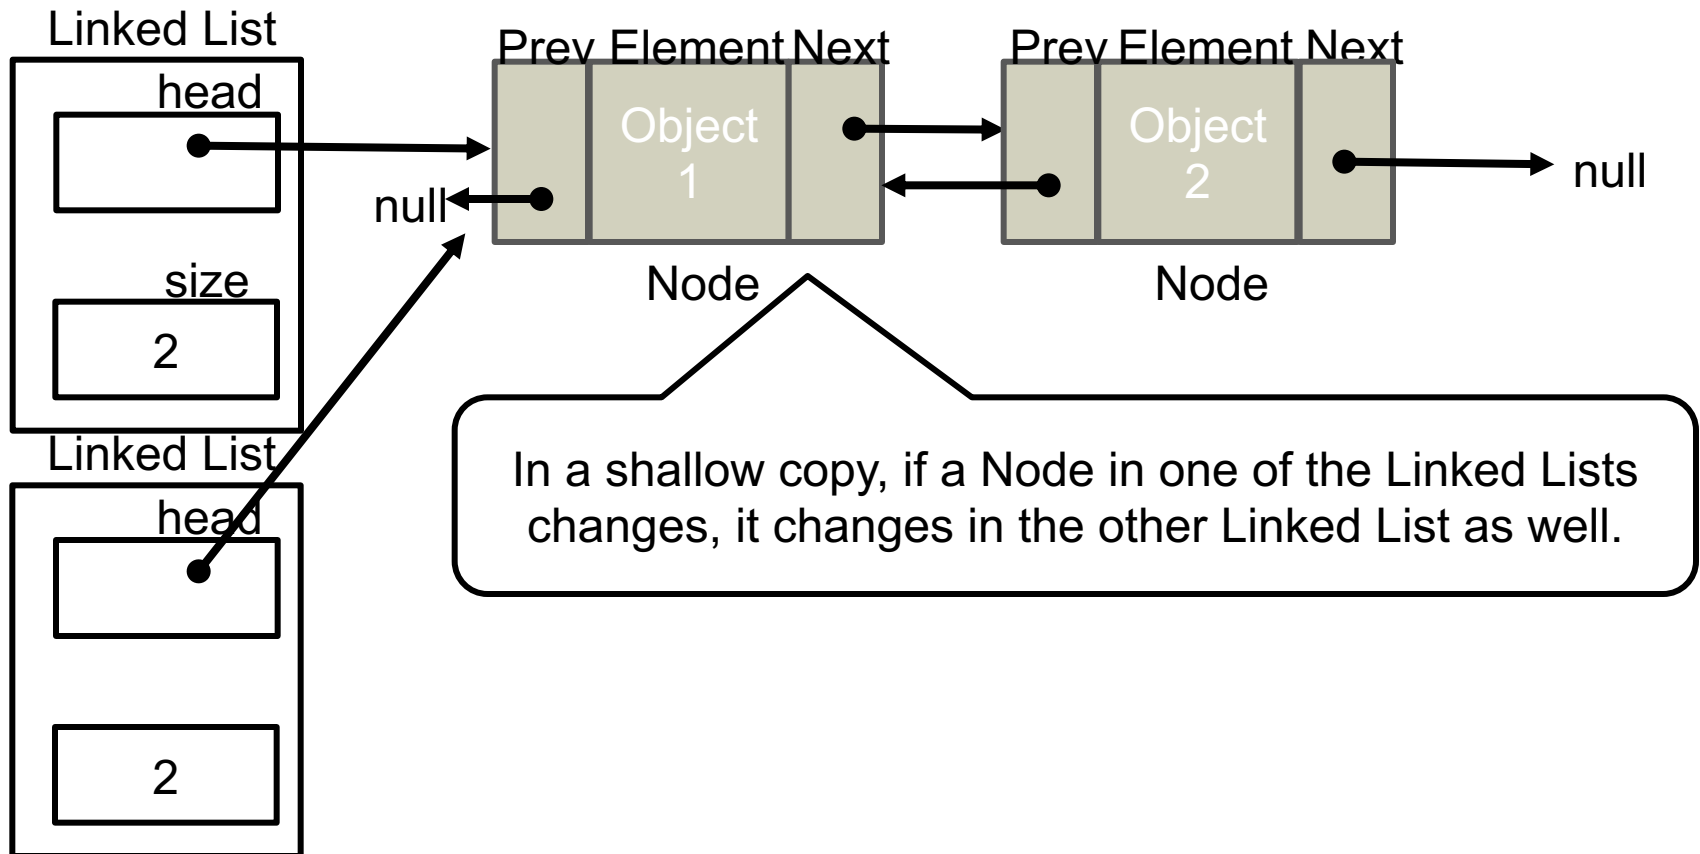

# COPYING DATA STRUCTURES

Suppose we copy a linked list by copying the head and size:

# COPYING DATA STRUCTURES

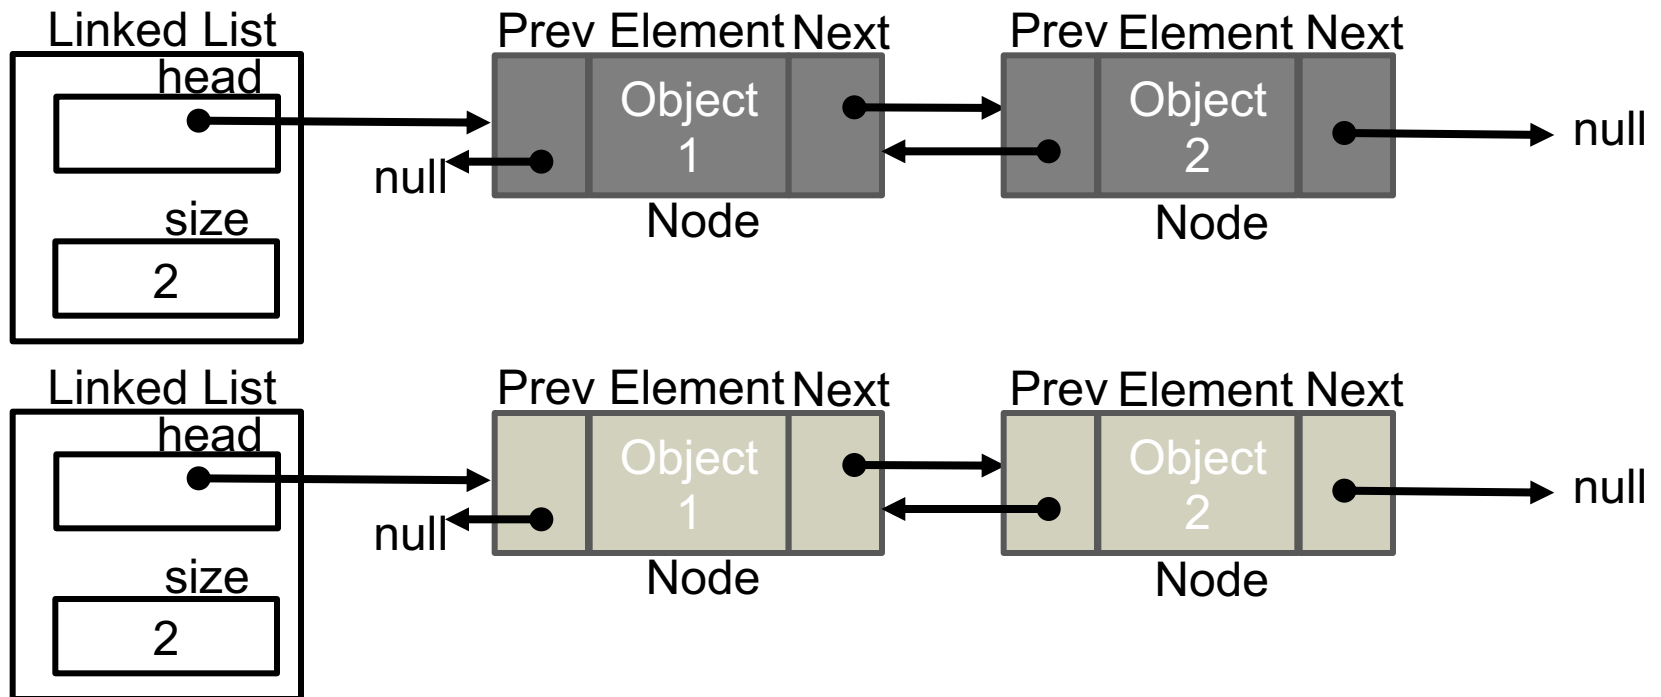

Suppose we copy a linked list by copying the head and size:

# COPYING DATA STRUCTURES

What if we want to make sure that we can change one of the Linked Lists without changing the other?

We need to copy each Node's element. This is a **deep copy**

# HANDOUT 9 EXAMPLE
